About this document

This document describes Management Information Base (MIB) and objects in them, which are supported by Hewlett Packard Enterprise products. It is supposed that this document gives a guideline for usage of MIBs in Hewlett Packard Enterprise products.

Introduction

This document contains “Public MIB List” section and “Private MIB list” section.

The “Public MIB List” provides a MIB list containing the Internet standard MIBs supported by products. The “Private MIB List” provides Hewlett Packard Enterprise private MIB list.

The following chapters describe the implementation of the objects of all public and private MIBs.

At the end of document, supported traps are presented.

Consideration

Whether all MIBs listed here are supported by products

This document provides a collection of MIBs to meet the needs of HPE 5900&5920&5930 Switch series of products. However, a MIB is not necessarily supported even if it is included in a specific product software release. Some MIBs may work (The MIB objects can be read, or set from an NMS.), but they have not been verified or tested on any products.

If a MIB (or MIB object) is included in a software release but not in this document, this MIB (or MIB object) is not supported (not tested at least). If a MIB (or MIB object) can work, but is commented as “Not supported”, it is not supported (or not tested at least).

This document provides you with abundant MIBs. A MIB is supported only if the corresponding feature or function is supported. And if a MIB (table or scalar object) is not in this document, it represents that this MIB (table or scalar object) is not supported.

If a MIB is not supported or implemented, the notifications or traps (if any) of the MIB are not supported as well.

In consideration of compatibility with the lower versions and third party NMS implementation, some MIBs are deprecated and/or obsolete, but they cannot be removed from the software release.

MIBs and MIB objects may be updated (adding new ones or modification to the old ones). To get specific MIB information, refer to the newest private MIB structure and Internet Standard MIBs supported by Hewlett Packard Enterprise.

Difference between MIB and Command Line Interface (CLI)

Although you can perform configurations on the device through MIB, CLI is a basic way to make configurations on the device. In some cases, MIB operations and

CLI operations have the same effect.

There are some limits on the usage of characters at the CLI. For example, in the following CLI, space is used as a delimiter to separate sysname and AAA.

[HEP] sysname AAA

Character ‘?’ is used as a help indicator in the CLI. If you type the character ‘?’ in the following CLI, a help message is displayed.

For example:

[HPE] sysname ?

STRING<1-30> System name (1 to 30 characters)

Because of the limitation of the length of the CLI, some configurations for “OCTET STRING” MIB object via SNMP may not be restored at the CLI. You are recommended to take the length limitation of CLI into account when executing configurations via MIB.

If the value of a MIB object in the set operation contains special characters, such as ‘?’ or space, you can perform the set operation via MIB, but the value of these MIB objects cannot be restored at the CLI, and information will be lost. Therefore, you are recommended to use visible characters (from 0x21 to 0x7E, except for 0x3F ‘?’) when performing MIB operations.

Table Format of MIB Information

In this document, scalar and tabular MIB object information is presented with the following table format. The Trap object excluded from such format of table.

Name	Access	PDS	Description
ifIndex (1.3.6.1.2.1.2.2.1.1)	read-only	Yes	As per MIB

The meanings of each column of the table are listed below.

Item	Comments
'Name'	Name of the MIB object
'Access'	The ACCESS or MAX-ACCESS value as defined in MIBs.
'PDS'	<p>Permanent Data Storage. This field describes what will happen for MIB objects after device reboots.</p> <p>There are three statuses:</p> <p>'Yes': After the value of a MIB object changed, the value of MIB object was saved automatically into device, the MIB object can remain the same value after device reboots.</p> <p>'No': whatever action is done, the value of MIB object will not remain after device reboots. Please note the 'PDS' of Counter/Counter32/Counter64 MIB object should be always 'No'.</p> <p>'Current': After the value of a MIB object changed, if the value of MIB object is saved explicitly (such as via 'save' CLI command), it can remain after device reboots. Otherwise, if not save explicitly, the value of MIB object will be lost.</p>
'Description'	<p>General comments. All specific information are provided here.</p> <p>The following contents are just examples.</p> <p>'As per MIB': Just as described in the MIB.</p> <p>'Not supported': The object is not supported, although it can be operated (read and/or write). The user should not use such MIB object.</p> <p>'Product specific': The information is product specific. Although information may provided in this field for some products, we cannot assure to list all product information. To find product specific information, users can access the device via SNMP.</p>

Maintenance statement

This document is used for MIBs supported by HPE 5900&5920&5930 Switch software only. Differences between MIBs of different products must be provided. This document should not be directly delivered to end users. Relevant departments must adjust the contents of this document to fit in its requirement before delivering it to such end users.

Public MIBs list

In this section, all public MIBs supported by platform are listed.

Any action to modify, delete, remove and add must be recorded in Revision History.

In File name column, the MIB file name must follow by the naming rule, which is the MIB module name prefixed with the RFC index like rfc2737-entity.mib. Note that file name is lowercase.

In MIB Version column, it indicates the MIB version used in devices.

3.2 pingCtlTable

OID of this table is: 1.3.6.1.2.1.80.1.2

1.1 The parameter which is not supported by the corresponding pingCtlType cannot be configured.

1.2 When creating a test entry, the default value of pingCtlType is pingIcmpEcho. Once created, pingCtlType cannot be changed, so pingCtlType must be set as the entry created.

1.3 When creating an entry, if the parameter which is not supported by the corresponding pingCtlType is set, the operation will be failed.

1.4 Any of the configurations in pingCtlTable changed, the corresponding results, histories and statistics will be cleared, except the following objects:

pingCtlTrapGeneration,

pingCtlTrapProbeFailureFilter,

pingCtlTrapTestFailureFilter,

pingCtlDescr,

pingCtlMaxRows(If the value of this object is smaller than the previous value, the redundant histories records will be deleted.)

The results, histories and statistics must be the factual reflection of the test results of current configurations.

Users will be puzzled when they get the results which caused by the previous configurations.

1.5 pingCtlTargetAddressType and pingCtlTargetAddress must be modified together.

1.6 pingCtlSourceAddressType and pingCtlSourceAddress must be modified together.

1.7 If the parameter which is not supported by the corresponding pingCtlType is read, the result is invalid.

The following objects are supported by all pingCtlTypes:

pingCtlOwnerIndex, pingCtlTestName, pingCtlTimeOut,

pingCtlAdminStatus, pingCtlFrequency,

pingCtlStorageType, pingCtlTrapGeneration, pingCtlType, pingCtlDescr,

pingCtlRowStatus

The remainder objects is supported by part of pingCtlTypes.

The relationship between these objects and corresponding pingCtlType are described in the following table:

5 ENTITY-MIB

This MIB is supported only when the products support RFC4133.

This chapter describes the information of Entity MIB. The Entity MIB contains five groups of MIB objects: entityPhysical group, entityLogical group, entityMapping group, entityGeneral group and entityNotifications group. Thereinto, the entityPhysical group describes the physical entities managed by a single agent. This group contains a single table to identify physical system components, called the entPhysicalTable. The entPhysicalTable contains one row per physical entity, and must always contain at least one row for an "overall" physical entity, which should have an entPhysicalClass value of 'stack(11)', 'chassis(3)' or 'module(9)'. Each row is indexed by an arbitrary, small integer, and contains a description and type of the physical entity. It also optionally contains the index number of another entPhysicalEntry indicating a containment relationship between the two.

The entityLogical group describes the logical entities managed by a single agent. This group contains a single table to identify logical entities, called the entLogicalTable. The entLogicalTable contains one row per logical entity. Each row is indexed by an arbitrary, small integer and contains a name, description, and type of the logical entity. It also contains information to allow access to the MIB information for the logical entity. This includes SNMP versions that use a community name (with some form of implied context representation) and SNMP versions that use the SNMP ARCH [RFC2571] method of context identification. If a agent represents multiple logical entities with this MIB, then this group must be implemented for all logical entities known to the agent. If an agent represents a single logical entity, or multiple logical entities within a single naming scope, then implementation of this group may

be omitted by the agent.

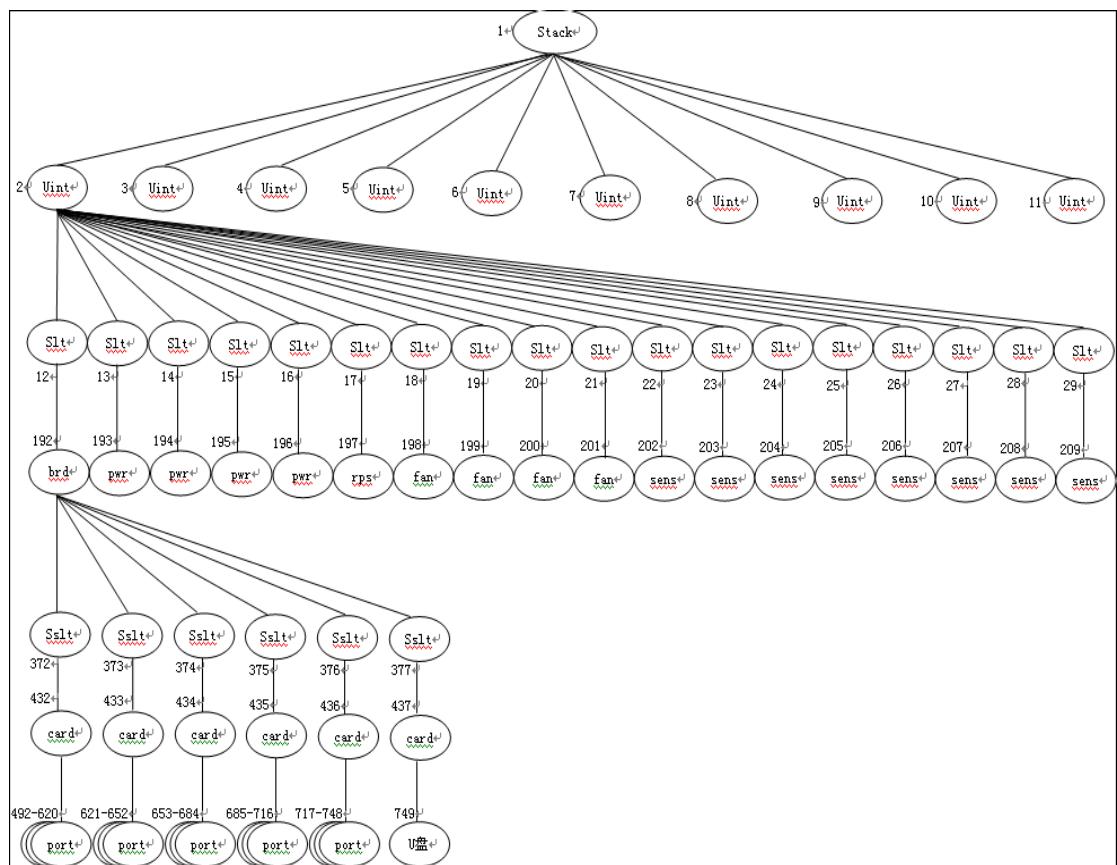

The entityMapping group describes the associations between the physical entities logical entities, interfaces, and non-interface ports managed by a single agent. This group contains three tables to identify associations between different system components. The entLPMappingTable contains mappings between entLogicalIndex values (logical entities) and entPhysicalIndex values (the physical components supporting that entity). A logical entity can map to more than one physical component, and more than one logical entity can map to (share) the same physical component. If an agent represents a single logical entity, or multiple logical entities within a single naming scope, then implementation of this table may be omitted by the agent. The entAliasMappingTable contains mappings between entLogicalIndex, entPhysicalIndex pairs and 'alias' object identifier values. This allows resources managed with other MIBs (e.g., repeater ports, bridge ports, physical and logical interfaces) to be identified in the physical entity hierarchy. Note that each alias identifier is only relevant in a particular naming scope. If an agent represents a single logical entity, or multiple logical entities within a single naming scope, then implementation of this table may be omitted by the agent. The entPhysicalContainsTable contains simple mappings between 'entPhysicalContainedIn' values for each container/'containe' relationship in the managed system. The indexing of this table allows an NMS to quickly discover the 'entPhysicalIndex' values for all children of a given physical entity.

The entityGeneral group describes general system attributes shared by potentially all types of entities managed by a single agent. This group contains general information relating to the other object groups. At this time, the entGeneral group contains a single scalar object (entLastChangeTime), which represents the value of sysUptime when any part of the Entity MIB configuration last changed.

The entityNotifications group contains status indication notifications. This group contains notification definitions relating to the overall status of the Entity MIB

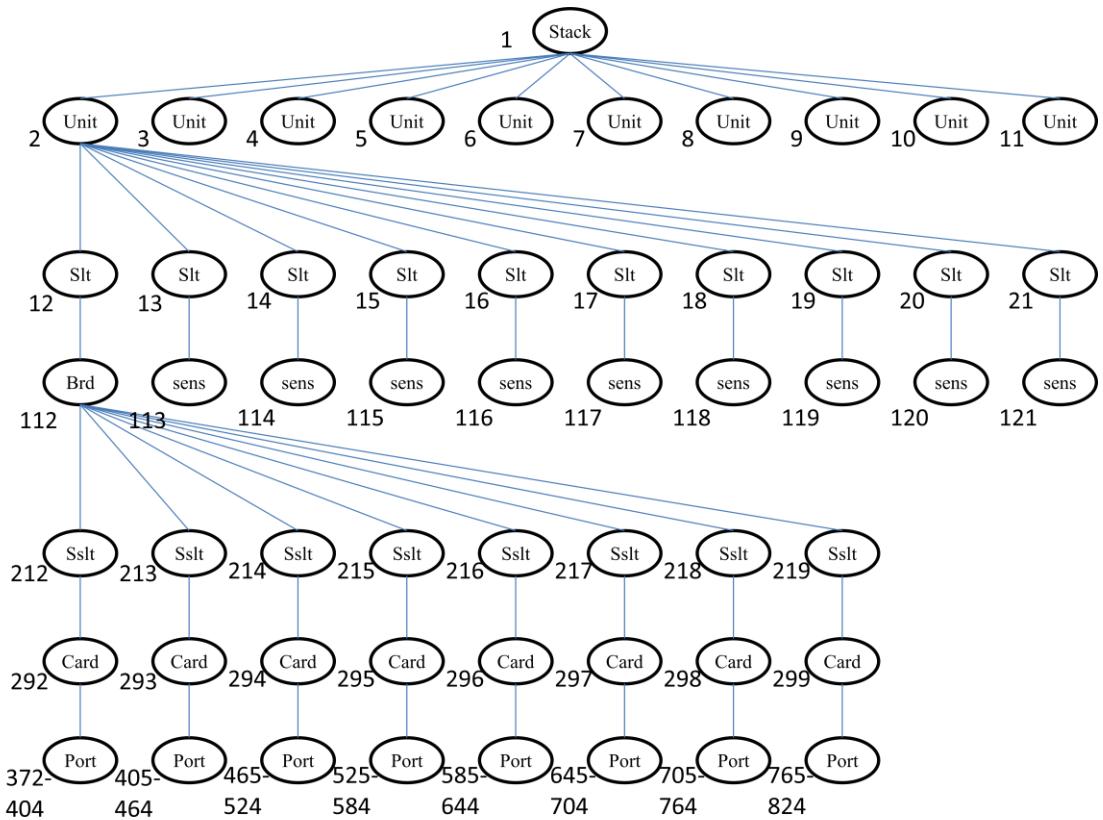

instantiation.

The following table shows the index range of each physical class of each stack in HPE 5900&5920&5930 Switch products. It supports 10 units in a stack at max. To compatible with old HPE 5900&5920&5930 devices, there are 1 slot, 1~4 PSU, 0~1 RPS, 1~4 Fans and 1~8 Sensors as level 1 containers, and 6 sub slots as level 2 containers in one unit. There are front panel sub slot, stacking ports sub slot, expansion card sub slots, USB sub slot. The max port number in a sub slot is 128, which are 32 fixed QSFP+ ports that can work as 4 SFP+ ports. It also support 1 out-band management port. Such as the figure and the table shown:

The following table shows the index range of each physical class of each stack in TbirdSwitch products. It supports 10 units in a stack at max. There are 1 slot and 1~9 Sensors as level 1 containers, and 8 sub slots as level 2 containers in one unit. There are front panel sub slot, stacking ports sub slot, expansion card sub slots. Such as

By default, all Base VIDs are mapped to ECT algorithm 1.

If a Base VID which are mapped to ECT algorithm 1 has not been mapped to MSTI 4092, then the Base VID can't displayed in the table.

If a entry using a Base VID which are mapped to MSTI 4092 was destroyed, it would recovered to mapped to ECT algorithm 1 with the Base VID.

16 IGMP-STD-MIB

The IGMP-STD-MIB contains two tables:

- (1) the IGMP Interface Table which contains one row for each interface on which IGMP is enabled, and
- (2) the IGMP Cache Table which contains one row for each IP multicast group for which there are members on a particular interface.

Both tables are intended to be implemented by hosts and routers, but some columnar objects in each table apply only to routers.

43.2 sFlowRcvrTable

OID of this table is: 1.3.6.1.4.1.14706.1.1.4

Name	Access	PDS	Description
sFlowRcvrIndex (1.3.6.1.4.1.14706.1.1.4.1.1)	not-accessible	Current	Range from 1 to 10.
sFlowRcvrOwner (1.3.6.1.4.1.14706.1.1.4.1.2)	read-write	Current	When claim an sFlowRcvrTable entry, the entity taking control of the sampler must set both the owner and a value for sFlowRcvrTimeout in the same SNMP set request.
sFlowRcvrTimeout (1.3.6.1.4.1.14706.1.1.4.1.3)	read-write	Current	When reading or writing a permanent sFlowRcvrTable entry, the value will be -1.
sFlowRcvrMaximumDatagramSize (1.3.6.1.4.1.14706.1.1.4.1.4)	read-write	Current	Range from 200 to 3000.
sFlowRcvrAddressType (1.3.6.1.4.1.14706.1.1.4.1.5)	read-write	Current	As per MIB
sFlowRcvrAddress (1.3.6.1.4.1.14706.1.1.4.1.6)	read-write	Current	As per MIB
sFlowRcvrPort (1.3.6.1.4.1.14706.1.1.4.1.7)	read-write	Current	As per MIB
sFlowRcvrDatagramVersion (1.3.6.1.4.1.14706.1.1.4.1.8)	read-write	Current	Only support V5.

43.3 sFlowFsTable

OID of this table is: 1.3.6.1.4.1.14706.1.1.5

Name	Access	PDS	Description

Name	Access	PDS	Description
sFlowFsDataSource (1.3.6.1.4.1.14706.1.1.5.1.1)	not-accessible	Current	As per MIB
sFlowFsInstance (1.3.6.1.4.1.14706.1.1.5.1.2)	not-accessible	Current	When setting the sFlowFsTable, this value must be 1. Only one instance is supported for one datasource on device.
sFlowFsReceiver (1.3.6.1.4.1.14706.1.1.5.1.3)	read-write	Current	The range depends on sFlowRcvrTable. When the receiver expires, the value is not changed.
sFlowFsPacketSamplingRate (1.3.6.1.4.1.14706.1.1.5.1.4)	read-write	Current	The range is product specific. A sampling rate of 0 disables sampling.
sFlowFsMaximumHeaderSize (1.3.6.1.4.1.14706.1.1.5.1.5)	read-write	Current	Range from 18 to 512.

43.4 sFlowCpTable

OID of this table is: 1.3.6.1.4.1.14706.1.1.6

Name	Access	PDS	Description
sFlowCpDataSource (1.3.6.1.4.1.14706.1.1.6.1.1)	not-accessible	Current	As per MIB
sFlowCpInstance (1.3.6.1.4.1.14706.1.1.6.1.2)	not-accessible	Current	When setting the sFlowCpTable, this value must be 1. Only one instance is supported for one datasource on device.
sFlowCpReceiver (1.3.6.1.4.1.14706.1.1.6.1.3)	read-write	Current	The range depends on sFlowRcvrTable. When the receiver expires, the value is not changed.
sFlowCpInterval (1.3.6.1.4.1.14706.1.1.6.1.4)	read-write	Current	Range from 2 to 86400. A sampling interval of 0 disables counter sampling.

44 SNMP-FRAMEWORK-MIB

44.1 Snmp Framework AdminSnmp Engine Group

Name	Access	PDS	Description
snmpEngineID (1.3.6.1.6.3.10.2.1.1)	read-only	Current	As per MIB
snmpEngineBoots (1.3.6.1.6.3.10.2.1.2)	read-only	Yes	See the algorithm of snmpEngineBoots below
snmpEngineTime (1.3.6.1.6.3.10.2.1.3)	read-only	No	As per MIB
snmpEngineMaxMessageSize (1.3.6.1.6.3.10.2.1.4)	read-only	Current	As per MIB

44.2 The allocation algorithm of snmpEngineID

The snmpEngineID has a length of 16 octets:

The first four octets are set to the binary equivalent of the agent's SNMP management private enterprise number as assigned by the Internet Assigned Numbers Authority (IANA), and the very first bit is set to 1. For example, if Hewlett Packard Enterprise Networks has been assigned enterprises 25506, the first four octets would be assigned '8000063A2'H.

For routers, the remaining eight octets are random octets.

For switches, the fifth octet is 8 indicates that the following is enterprise-specified. The following six octets are the MAC address. The remaining four octets are the MDC number.

44.3 The algorithm of snmpEngineBoots

If SNMP becomes enabled from disabled, then the snmpEngineBoots increments 1.

If the snmpEngineID has been configured and its value differs from the former

one, then the snmpEngineBoots is reverted to 1.

If the snmpEngineTime reaches its maximum value then the snmpEngineBoots increments 1.

47 SNMP-TARGET-MIB

snmpTargetAddrTable and snmpTargetParamsTable combined are used to create a valid target host row in device. The command line corresponding to this entry can be displayed as “snmp-agent target-host trap address udp-domain ...”. There are some rules need conformed with.

For a valid target host entry which is made up of one entry in snmpTargetAddrTable and another entry in snmpTargetParamsTable:

- 1) The value of snmpTargetAddrName is the same as the value of snmpTargetAddrParams.
- 2) The value of snmpTargetAddrParams is the same as the value of snmpTargetParamsName.
- 3) The value format of snmpTargetAddrName is something like “traphost.” + snmpTargetParamsSecurityName + IpAddress+ VPN Instance name. The IpAddress is the ip address part of snmpTargetAddrTAddress. If not support VPN, VPN Instance name does not need to be configured.
- 4) The value of snmpTargetAddrTagList must be octet string “TrapHost”.
- 5) For IPV4, the value of snmpTargetAddrTDomain must be snmpUDPDomain.
- 6) The value of snmpTargetAddrStorageType should be nonVolatile.
- 7) The length of snmpTargetParamsSecurityName in snmpTargetAddrParams restricted in 1 to 32 octets.
- 8) The length of VPN Instance name in snmpTargetAddrParams restricted in 1 to 31 octets.

59.2 hh3cCBQoSClassifierCfgInfoTable

OID of this table is: 1.3.6.1.4.1.25506.2.65.2.1.1.2

This table does not support to modify the variable of existing entry, only supports to create a new entry and destroy an existing entry.

When creating a new entry of this table:

- (1) Get the value of hh3cCBQoSClassifierIndexNext.
- (2) Use the value as hh3cCBQoSClassifierIndex to create the new entry of this table.
- (3) hh3cCBQoSClassifierName must be bound when creating a new entry of this table.
- (4) hh3cCBQoSClassifierRuleCount stands for the number of nodes in the classifier, including the nodes that are only supported by the command line.

61 HH3C-CONFIG-MAN-MIB

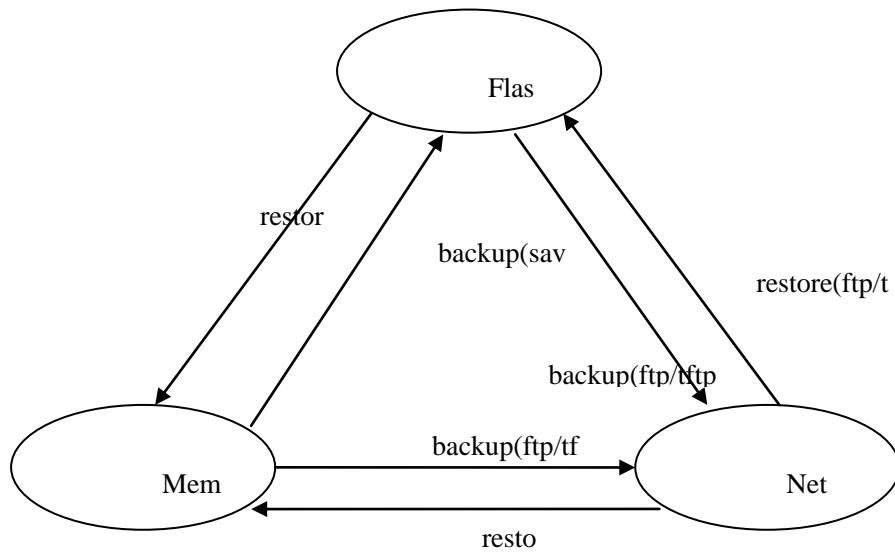

A configuration management MIB, includes configuration log management and Backup & Restore operation of configuration.

All the configuration change events can be managed by the log management MIB.

The configuration may be changed by CLI, SNMP or other ways defined as the MIB.

Backup & Restore MIB group provides the configuration backup and restore among flash, memory and network.

Note: Writing flash can be done by backup(save) as described in figure below.

66 HH3C-ENTRELATION-MIB

66.1 hh3cEntRelationTable

OID of this table is: 1.3.6.1.4.1.25506.2.15.1.1.1

Name	Access	PDS	Description
hh3cEntRelationType (1.3.6.1.4.1.25506.2.15.1.1.1.1)	not-accessible	No	Only support the relation of Combo.
hh3cEntityIndex (1.3.6.1.4.1.25506.2.15.1.1.1.2)	not-accessible	No	The entity is a default combo port. The value of it equals to one of the entPhysicalIndex.
hh3cRelatedEntityIndex (1.3.6.1.4.1.25506.2.15.1.1.1.3)	read-only	No	Not supported

67 HH3C-EVB-MIB

EVB management information base for managing devices that support Ethernet Virtual Bridging. This MIB is an extension of IEEE8021-EVB-MIB.

67.1 Scalar Objects

Name	Access	PDS	Description
hh3cEvbSetResult(1 .3.6.1.4.1.25506.2.134.1. 1)	read-only	Current	As per MIB

67.2 hh3cEvbDefaultManagerTable

Note: hh3cEvbManagerType must be set when creating a new instance of this table, hh3cEvbManagerID and hh3cEvbManagerPort must be deleted when creating a new instance of this table if hh3cEvbManagerType is 'local', hh3cEvbManagerID should be set simultaneity when creating if hh3cEvbManagerType is 'ipv4/ipv6' or 'name'. hh3cEvbManagerID must be set if turning hh3cEvbManagerType to 'ipv4/ipv6/name'. If hh3cEvbManagerType is 'local', hh3cEvbManagerID becomes zero-length string automatically, and hh3cEvbManagerPort becomes default value, which can't be modified.

77.1 hh3clfQoSConfigTable

OID of this table is: 1.3.6.1.4.1.25506.2.65.1.3.1

In the set operation, hh3clfQoSConfigCir, hh3clfQoSConfigCbs should be set following the range. Get the range using the table hh3cQoSConfigTable.

hh3clfQoSConfigCir must be bound in a set operation. If hh3clfQoSConfigCbs is not bound in the set operation, the value will be given by the system.

77.3 hh3clfQoSWeightTable

OID of this table is: 1.3.6.1.4.1.25506.2.65.1.1.1.2

The set operation of this table only supports multiple variable bindings.

If the system supports hh3clfQoSQueueGroupType, variables that must be bound in a set operation include hh3clfQoSQueueGroupType, or hh3clfQoSQueueGroupType must not be bound in the set operation.

If the hh3clfQoSQueueGroupType is group0(1), hh3clfQoSQSType and hh3clfQoSValue must not be bound in the set operation.

If the hh3clfQoSQueueGroupType is group1(2) or group2(3), hh3clfQoSQSType and hh3clfQoSValue must be bound in the set operation.

If the system does not support hh3clfQoSQueueGroupType, hh3clfQoSQueueGroupType must not be bound in the set operation. And variables that must be bound in the set operation include hh3clfQoSQSType and hh3clfQoSValue.

If the hh3clfQoSMinBandwidth is set, the hh3clfQoSMode must be wfq mode.

1.hh3cdot1qVlanMIBTable is used for VLAN information management and monitor, It can be used for VLAN row creation, deletion, and VLAN property configuration and query.

In this table the leaf node can be classified as configure node and query node, configure node can both be used for configure and query purposes, while query node can be used for query only.

The configure nodes in this table include:

hh3cdot1qVlanName

hh3cdot1qVlanPorts

hh3cdot1qVlanType

hh3cdot1qVlanPriority

hh3cdot1qVlanRowStatus

hh3cdot1qVlanBroadcastSuppression

hh3cdot1qVlanBcastSuppressionPPS

hh3cdot1qVlanMulticast (Not support)

Rest of the leaf nodes are query nodes.

2.hh3cdot1qVlanMIBTable configuration instruction:

hh3cdot1qVlanMIBTable use VLAN Index as the table index, which is normally called VLANID,

If a row is to be created, it is recommended to traverse this table first and use the unused VLAN index to create the row. In this table rowstatus only support active(1), createAndGo(4), destroy(6).

For this MIB, there are two kinds of operation:

2.1 hh3cdot1qVlanRowStatus(createAndGo(4)) and nodes are set together

When the rowstatus node and the following nodes are set simultaneously

hh3cdot1qVlanName

hh3cdot1qVlanPorts

hh3cdot1qVlanType

hh3cdot1qVlanPriority

hh3cdot1qVlanBroadcastSuppression

hh3cdot1qVlanBcastSuppressionPPS

hh3cdot1qVlanMulticast (Not support)

For hh3cdot1qVlanName, VLAN name string check is performed, the row is created only if the string check succeeds.

For rest of the leaf nodes listed above, the row will be created before setting the properties. If errors happen when setting the properties, the operation will fail while the row has already been created.

Here are some examples for the error mentioned above:

1) hh3cdot1qPorts: through this MIB node only access type ports can be added or deleted. Operation will fail while the row has already been created, if some of the ports to be added or deleted are not of access type.

2) hh3cdot1qVlanType: with value sub-vlan(3) cannot be set using this MIB, when rowstatus(createAndGo(4)) and hh3cdot1qVlanType(sub-vlan(3)) are set

together, Operation will fail while the row has already been created.

It is recommended to set hh3cdot1qVlanRowStatus(createAndGo(4)) and other node properties separately to avoid such kind of error.

2.2 Row already exist and set node properties:

For the following nodes:

hh3cdot1qVlanName The name length cannot exceed 32 characters.

hh3cdot1qVlanPorts To set the node successfully you should first get the value of the node, and then only change the corresponding bit of the access port.

hh3cdot1qVlanType sub-vlan(3) secondary-vlan(5) cannot be set using this MIB

hh3cdot1qVlanPriority

hh3cdot1qVlanBroadcastSuppression

hh3cdot1qVlanBcastSuppressionPPS

hh3cdot1qVlanMulticast (Not support)

3. configuration example

1) Configuration success

hh3cdot1qVlanRowStatus(createAndGo(4)) are set together with hh3cdot1qVlanName using value "vlantest", use the index unused in this table, the row is created and hh3cdot1qVlanName is set successfully.

2) Configuration fail

Precondition: there is trunk type port existing on the device and port not belongs to this vlan. hh3cdot1qVlanRowStatus(createAndGo(4)) and hh3cdot1qVlanPorts

with trunk port corresponding bit in the octet string setting to 1 are set together,

Operation will fail while the row has already been created.

98 HH3C-NPV-MIB

The HH3C-NPV-MIB is for the management of N_port Virtualization or NPV within the framework of N_port virtualization(NPV) architecture. N_Port virtualization reduces the number of Fibre Channel domain IDs in SANs (Storage Area Network). Switches operating in the NPV mode do not join a fabric; rather, they pass traffic between NPV core switch links and end-devices, which eliminate the domain IDs for these edge switches.

102 HH3C-RADIUS-MIB

The HH3C-RADIUS-MIB is a configuration management and statistical MIB, includes configuration of RADIUS Server, and statistics about Accounting Server which complements the IETF standard MIB. In addition, there are two traps supported to notify the RADIUS Server's down state.

Note: Creating and deleting a row in either hh3cRdInfoTable or hh3cRdAccInfoTable will work on another table. That is, to create a new row in hh3cRdInfoTable, a row with the same group name will appear in hh3cRdAccInfoTable. To delete a row from hh3cRdInfoTable, corresponding row in hh3cRdAccInfoTable will be cleared away and vice versa.

Server parameters in hh3cRdInfoTable and hh3cRdAccInfoTable can not be set unless server ip has been set first.

❖ Terms

(The terms listed below are just used in the range of this section.)

BootRom: a special program which is used to boot the system on system startup.

BOOT ROM: a specific zone in system in which a BootRom is stored.

Bootrom file: a file which exists in file system. The content of such file is BootRom.

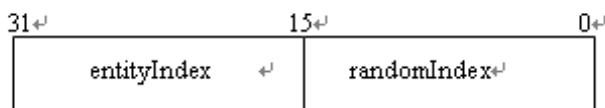

❖ Function

The responsibility of this table is to update BootRom from a BootRom file in file system to BOOT ROM.

It assumes that the source Bootrom file already exists in the file system of the device before doing operation. On system startup, this table is empty.

❖ Notes

- 1) Be careful that the operation on BOOT ROM updating is risky. Other operations may halt during updating BOOT ROM. Such operation may take a long time as well.
- 2) The value of hh3cSysCurUpdateBtmFileName will not be updated until updating operation completed.
- 3) The value of hh3cSysBtmLoadIndex is divided into two parts as follows:

The entityIndex is the same as entPhysicalIndex as defined in the entPhysicalTable, and must be the entPhysicalIndex of the entity whose entPhysicalClass is ‘module’. The randomIndex is determined by users. Algorithm of hh3cSysBtmLoadIndex:

`hh3cSysBtmLoadIndex = (entityIndex << 16) | randomIndex`

- 4) It is strongly recommended that the name of a Bootrom file ends with valid filename extention, but this table will not check the filename. The verification of validity of a Bootrom file will be performed after the hh3cSysBtmRowStatus of this instance turns into ‘active’.
- 5) hh3cSysBtmFileName must include a path.
- 6) At present, hh3cSysBtmFileType must be set to ‘main’.
- 7) All necessary objects, which are hh3cSysBtmFileName and hh3cSysBtmFileType, should be provided with hh3cSysBtmRowStatus simultaneously in creation.
- 8) hh3cSysBtmErrorStatus can be used to get current progress or result of the

updating operation. At any time, there is only one instance of which the hh3cSysBtmErrorStatus is ‘inProgress’ in the same device. Creating a new instance will fall into fail if there is an instance of which hh3cSysBtmErrorStatus is ‘inProcess’.

9) If there is an attempt to remove the instance of which the hh3cSysBtmErrorStatus is ‘inProgress’, such attempt may fail.

The Boot Rom in BOOT ROM cannot be removed through hh3cSysBtmLoadTable, but it can be updated through this table.

When removing an instance from this table, there is no any deletion of the corresponding file in file system.

After updating a Bootrom file into BOOT ROM, the corresponding file can be removed from the file system, but it is not the responsibility of this table to remove a Bootrom file from the file system.

10) Please refer to the product guideline to make sure that the module supports updating.

✧ Examples

Creating a new instance.

A valid Bootrom file named with “flash:/lsws5820x6019_v1.15.btw” is supposed existing in file system.

The entPhysicalIndex of the entity (the entPhysicalClass of this entity is ‘module’) is 2 (Here the value 2 is used just as illustration, the actual value must be got from entPhysicalIndex in entPhysicalTable of ENTITY-MIB), the customized randomIndex is 1. Then the value of hh3cSysBtmLoadIndex is 131073, and the value of the necessary objects should be set to:

hh3cSysBtmFileName.131073 = “flash:/lsws5820x6019_v1.15.btw”

hh3cSysBtmFileType.131073 = ‘main’

hh3cSysBtmRowStatus.131073 = 'createAndGo'

111 HH3C-TRNG2-MIB

This MIB is used to manage time-range.

When creating an absolute time-range, configure

hh3cTrngCreateTimerangeTable firstly, then use the value of hh3cTrngIndex as the value of hh3cTrngAbsoluteNameIndex to create hh3cTrngAbsoluteTable.

When creating a periodic time-range, configure hh3cTrngCreateTimerangeTable firstly, then use the value of hh3cTrngIndex as the value of hh3cTrngPeriodicNameIndex to create hh3cTrngPeriodicTable.

If hh3cTrngCreateTimerangeTable is configured, hh3cTrngAbsoluteTable and hh3cTrngPeriodicTable are not configured, time-range does not actually exist, and the configuration of hh3cTrngCreateTimerangeTable may be lost after saving and rebooting. The configuration of hh3cTrngCreateTimerangeTable does not support the configuration replace operation.
